Post-Top Luminaires

Our post-top luminaires are mounted on 20-foot fiberglass poles – with a low mounting height at about 16.5 feet. They also have underground supply voltage and are available with 100 Watt High Pressure Sodium (HPS) lamps.

We offer three basic styles of post-top luminaires:

Coach - Designed to complement many residential architectural styles, this decorative fixture provides beauty during the day and clear, functional lighting for roadways at night.

Great for residential streets, parks or areas that have a small amount of auto and pedestrian traffic.

Acorn - This traditional design has been upgraded with the addition of gold-tone trim and heavy, solid glass. With this design, most of the light is directed toward the street below while a soft light radiates from the fixture itself.

Ideal for residential roadways, parks and areas with light traffic.

Gothic - This is an excellent example of an ornate fixture that balances beauty and practicality.

Best when used for residential roadways, parks or areas that have minimal vehicular traffic and only some pedestrian traffic. The Gothic luminaire can also be used as supplemental decorative lighting.

Cobra Heads, Shoebox Luminaires

The versatility of our utility-grade Cobra Head and Shoebox luminaires make them ideal for use in a wide range of lighting applications, such as residential streets, high-traffic roadways, parking lots, and railway crossings.

Cobra Head fixtures are available on wood poles with an overhead supply, but can also be mounted on steel poles with the option of either overhead or underground supply voltage. Shoebox fixtures are mounted on steel poles with underground supply.

The three basic styles we offer include:

Standard Cobra Head - for moderately heavy traffic areas

Flat Glass Cobra Head - for areas requiring precise distribution of light and minimal glare into windows and the sky

Shoebox - lighting for high volume pedestrian and vehicular traffic, but with reduced glare
